FERTILIZER APPLICATION AND WOODY ENCROACHMENT ENHANCE NITROUS OXIDE EMISSIONS FROM SOIL; ANNUAL BURNING REDUCES IT

Priscilla Moley and Lydia H. Zeglin
Division of Biology, College of Arts and Science

BACKGROUND AND PURPOSE: Nitrous oxide, a greenhouse gas with about 300 times more warming potential than carbon dioxide, is primarily produced by the soil microbial processes of nitrification and denitrification. Frequent fire as well as fertilizer application are two common land management practices with the potential to greatly affect nitrification and denitrification, and therefore nitrous to greatly affect8L0 Gtrou7al7ll a-79 23230000-159thiBT/Fa-70(stud2 0 6a)4(n,00-159weB0

40

EVALUATING EPHEMERAL GULLIES WITH PHOTOGRAMMETRY AND COMPUTER MODELING

GROUP 5

42

DO WINTER CANOLA HYBRIDS AND OPEN-POLLINATED REQUIRE DIFFERENT SEEDING RATES?

Allison M. Aubert, Baylee M. Showalter, Kraig L. Roozeboom, Michael J. Stamm, and Gary L. Cramer

Department of Agronomy, College of Agriculture

BACKGROUND AND PURPOSE: Some Great Plains winter canola producers have turned to planting in 30-in. rows as a strategy to take advantage of residue management options that facilitate planting canola in high-
